

Data Types of Variables

- We know that variables are used to store a value/data and we can store different types of data into variables
- They are like:
 - Integer
 - Float
 - String
 - Boolean
- Examples:
 - a: 4
 - b: 5.6
 - c: VRTechnologies
 - d: “VR Technologies”
 - e: true or e: yes
 - f: false or f: no
- We can find the type of data which is stored in a variable using the plugin : `ansible.builtin.type_debug`
- We can also use its short name like `type_debug` but good practice is with FQCN

List All Plugins

➤ `ansible-doc -t filter -l`
